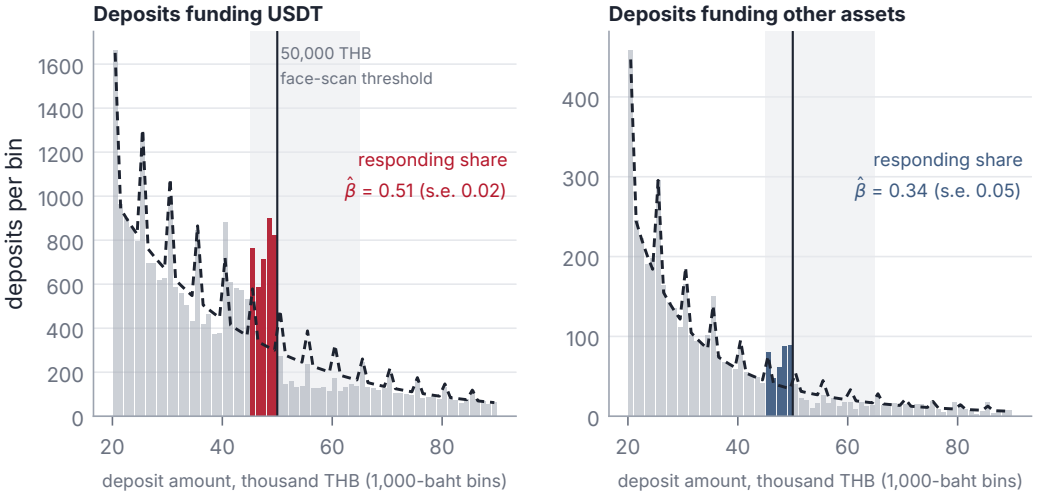
Structuring shows up as a difference in bunching, not as bunching itself

Both channels bunch below the threshold because honest users dislike the face scan. The USDT excess over other assets is the signal: difference = 0.17 (s.e. 0.06, one-sided p = 0.001). One simulated exchange-year, 2% mule accounts.



SIMULATED DATA · METHOD VALIDATION ONLY

Dashed line: Poisson-GLM counterfactual in log-amount with round-number effects, fitted outside the shaded exclusion window. Coloured bars: excess mass below the threshold.
